

Preface

The Imperial College of Science, Technology and Medicine conducts a very large programme of research in many areas of environmental science, technology and policy ranging from climate science, through engineering to environmental law. The diversity and flavour of this programme, which involves virtually every department of the College, is illustrated in this collection of inaugural lectures given by newly appointed professors in recent years.

The lectures are presented at a level which I hope will appeal to a broad cross-section of scientists and policy-makers working in this complex and strongly interdisciplinary field.
