<i>Foreword by Professor Ross C. McPhedran</i>	v
<i>Foreword by Professor Roy J. Taylor</i>	vii
<i>Preface</i>	xvii
1. Introduction	1
1.1 Conventional Optical Fibres	1
1.1.1 Guidance mechanism	1
1.1.2 Fibre modes	3
1.1.3 Main properties	3
1.1.3.1 Number of modes	3
1.1.3.2 Losses	4
1.1.3.3 Dispersion	5
1.1.3.4 Non-linearity	8
1.2 Photonic Crystals	9
1.2.1 One dimension: Bragg mirrors	10
1.2.2 Photonic crystals in two and three dimensions	11
1.3 Guiding Light in a Fibre with Photonic Crystals	12
1.3.1 Bragg fibres	13
1.3.2 Photonic crystal fibres and hollow core microstructured optical fibres	13
1.3.2.1 Hollow core MOFs	14
1.4 Solid Core MOFs	16
1.4.1 Guidance mechanism	16
1.4.2 Main properties and applications	17

1.5	Leaky Modes	19
1.5.1	Confinement losses	19
1.5.2	Modes of a leaky structure	20
1.5.3	Heuristic approach to physical properties of leaky modes	21
1.5.4	Mathematical considerations	23
1.5.5	Spectral considerations	25
2.	Electromagnetism – Prerequisites	27
2.1	Maxwell Equations	27
2.1.1	Maxwell equations <i>in vacuo</i>	27
2.1.2	Maxwell equations in idealized matter	29
2.1.2.1	Mesoscopic homogenization	29
2.1.2.2	Dispersion relations – Kramers-Kronig relations	30
2.2	The Monodimensional Case (<i>Modes, Dispersion Curves</i>)	34
2.2.1	A first approach	34
2.2.1.1	A special feature of the 1D-case: the decoupling of modes	34
2.2.1.2	Physics and functional spaces	36
2.2.1.3	Spectral presentation	38
2.2.1.4	Orthogonality of modes	39
2.2.2	Localisation of constants of propagation	39
2.2.3	How can one practically get the dispersion curves and the modes?	41
2.2.3.1	Zerotic approach	41
(a)	Modes in a <i>simple slab</i>	47
(b)	Modes in a <i>binary multilayered structure</i>	48
(c)	Some numerical results	49
2.2.4	Spectral approach	49
2.2.4.1	Strengths and weaknesses	49
2.2.4.2	The variational formulation (weak formulation)	53
2.2.4.3	An example of a <i>Hilbert-basis</i> in $L^2(\mathbb{R})$: the <i>Hermite polynomials</i>	55
2.3	The Two-Dimensional Vectorial Case (<i>general case</i>)	55
2.3.1	Some useful relations between transverse and axial components	57

2.3.2	Equations of propagation involving only the axial components	60
2.3.3	What are the special features of isotropic microstructured fibers?	61
2.4	The Two-Dimensional Scalar Case (<i>weak guidance</i>)	63
2.5	Spectral Analysis	64
2.5.1	Preliminary remarks	64
2.5.2	A brief vocabulary	65
2.5.3	Posing of the problem	66
2.5.4	Continuous formulation	67
2.5.5	Discrete finite element formulation	72
2.6	Bloch Wave Theory	72
2.6.1	The crystalline structure	72
2.6.2	Waves in a homogeneous space	73
2.6.3	Bloch modes of a photonic crystal	74
2.6.4	Computation of the band structure	78
2.6.5	A simple 1D illustrative example: the Kronig-Penney model	81
3.	Finite Element Method	89
3.1	Finite Elements: Basic Principles	89
3.1.1	A one-dimensional naive introduction	90
3.1.2	Multi-dimensional scalar elliptic problems	93
3.1.2.1	Weak formulation of problems involving a Laplacian	93
3.1.2.2	Generalizations	94
3.1.2.3	The finite element method	96
3.1.3	Mixed formulations	98
3.1.4	Vector problems	99
3.1.5	Eigenvalue problems	101
3.2	The Geometric Structure of Electromagnetism and Its Discrete Analog	107
3.2.1	Topology	108
3.2.2	Physical quantities	109
3.2.3	Topological operators	110
3.2.4	Metric	114
3.2.5	Differential complexes: from de Rham to Whitney	117
3.3	Some Practical Questions	122

3.3.1	Building the matrices (discrete Hodge operator and material properties)	122
3.3.2	Reference element	124
3.3.3	Change of coordinates	125
3.3.4	Nédélec edge elements vs. Whitney 1-forms	130
3.3.5	Infinite domains	132
3.3.5.1	Transformation method for infinite domains	133
3.3.5.2	Perfectly Matched Layer (PML)	134
3.4	Propagation Modes Problems in Dielectric Waveguides	135
3.4.1	Weak and discrete electric field formulation	136
3.4.2	Numerical comparisons	140
3.4.3	Variants	143
3.4.3.1	Looking for β with k_0 given	143
3.4.3.2	Discrete magnetic field formulation	144
3.4.3.3	Eliminating one component with the divergence	144
3.4.3.4	E_z, H_z formulation	146
3.5	Periodic Waveguides	146
3.5.1	Bloch modes	146
3.5.2	The Bloch conditions	148
3.5.3	A numerical example	150
3.5.4	Direct determination of the periodic part	151
3.6	Twisted Fibres	153
3.7	Conclusion	156
4.	The Multipole Method	157
4.1	Introduction	157
4.2	The Multipole Formulation	158
4.2.1	The geometry of the modelled microstructured optical fiber	158
4.2.2	The choice of the propagating electromagnetic fields	160
4.2.3	A simplified approach of the Multipole Method	160
4.2.3.1	Fourier-Bessel series	160
4.2.3.2	Physical interpretation of Fourier-Bessel series (no inclusion)	162
4.2.3.3	Change of basis	163

4.2.3.4	Fourier-Bessel series and one inclusion: scattering operator	164
4.2.3.5	Fourier-Bessel series and two inclusions: the Multipole Method	164
4.2.4	Rigorous formulation of the field identities	166
4.2.5	Boundary conditions and field coupling	169
4.2.6	Derivation of the Rayleigh Identity	170
4.3	Symmetry Properties of MOF	171
4.3.1	Symmetry properties of modes	171
4.4	Implementation	175
4.4.1	Finding modes	176
4.4.2	Dispersion characteristics	177
4.4.3	Using the symmetries within the Multipole Method	178
4.4.3.1	Another way to obtain $\Im m(\beta)$	179
4.4.4	Software and computational demands	180
4.5	Validation of the Multipole Method	181
4.5.1	Convergence and self-consistency	181
4.5.2	Comparison with other methods	184
4.6	First Numerical Examples	184
4.6.1	A detailed C_{6v} example: the six hole MOF	184
4.6.2	A C_{2v} example: a birefringent MOF	195
4.6.3	A C_{4v} example: a square MOF	197
4.7	Six Hole Plain Core MOF Example: Supercell Point of View	198
4.8	Conclusion	201
5.	Rayleigh Method	205
5.1	Genesis of Baron Strutt's Algorithm	205
5.2	Common Features Shared by Multipole and Rayleigh Methods	206
5.3	Specificity of Lord Rayleigh's Algorithm	209
5.4	Green's Function Associated with a Periodic Lattice	210
5.5	Some Absolutely Convergent Lattice Sums	211
5.6	The Rayleigh Identities	213
5.7	The Rayleigh System	215
5.8	Normalisation of the Rayleigh System	216
5.9	Convergence of the Multipole Method	217

5.10	Higher-order Approximations, Photonic Band Gaps for Out-of-plane Propagation	219
5.11	Conclusion and Perspectives	220
6.	<i>À la</i> Cauchy Path to Pole Finding	225
6.1	A Simple Extension: <i>Poles of Matrices</i>	228
6.1.1	Degenerate eigenvalues	232
6.1.2	Multiple poles inside the loop	233
6.1.3	Miracles sometimes happen	234
6.2	Cauchy integrals for operators	236
6.3	Numerical Applications	238
6.4	Conclusion	244
7.	Basic Properties of Microstructured Optical Fibres	247
7.1	Basic Properties of the Losses	247
7.2	Single-Modedness of Solid Core C_{6v} MOF	250
7.2.1	A cutoff for the second mode	251
7.2.2	A phase diagram for the second mode	253
7.3	Modal Cutoff of the Fundamental Mode	254
7.3.1	Existence of a new kind of cutoff	254
7.3.2	A phase diagram for the fundamental mode	259
7.3.3	Simple physical models below and above the transition region	261
7.4	Chromatic Dispersion	263
7.4.1	Material and waveguide chromatic dispersion	264
7.4.2	The influence of the number of rings N_r on chromatic dispersion	267
7.4.3	A more accurate MOF design procedure	268
7.5	A Hollow Core MOF with an Air-Guided Mode	271
7.5.1	The photonic crystal cladding	271
7.5.2	The finite structure	272
7.6	Conclusion	277
8.	Conclusion	281
Appendix A	A Formal Framework for Mixed Finite Element Methods	283
Appendix B	Some Details of the Multipole Method Derivation	287

B.1 Derivation of the Wijngaard Identity	287
B.2 Change of Basis	289
B.2.1 Cylinder to cylinder conversion	289
B.2.2 Jacket to cylinder conversion	289
B.2.3 Cylinder to jacket conversion	290
B.3 Boundary Conditions: Reflection Matrices	290
Appendix C A Pot-Pourri of Mathematics	295
