<i>Preface</i>	vii
1. Global Helioseismology: The Data	1
1.1 Intensity Variations	2
1.2 Velocity Variations	4
1.3 From Time-Series to Frequencies	9
1.4 Mode Ambiguities and Cross-Talk	17
1.5 Line Profile Asymmetries	22
1.6 Oscillations at High Frequencies	25
2. Global Helioseismology: Modelling	29
2.1 Separation of Time Scales	30
2.2 Equations of Hydrostatic Structure	32
2.3 Evolution of the Sun and Stars	38
2.4 Numerical Solution Techniques	41
2.4.1 Discretisation of a continuous potential	43
2.4.2 Discretisation in the presence of a discontinuity	47
2.5 The Resonances of Simple Systems	51
2.5.1 Resonant properties of some simple systems	54
2.5.2 Example I: Linear waves in a rectangular membrane	55
2.5.3 Example II: Linear waves in a circular membrane	57
2.5.4 Example III: Linear waves in a uniform sphere	58
2.6 Resonant Frequencies of the Sun and Stars	61
2.6.1 Derivation of the LAWE	61
2.6.2 Boundary conditions	68

2.7	Oscillations in the Cowling Approximation	69
2.8	JWKB Analysis	74
2.9	Surface Effects	79
2.10	Excitation and Damping of Modes	81
3.	Global Helioseismology: Inverse Methods	85
3.1	The Relationship between Frequencies and Sound Speed	87
3.1.1	Derivation of the variational structure kernels	94
3.1.2	Filtering out surface effects	100
3.2	The Abel Transform	102
3.3	The Relationship between Frequencies and Rotation	106
3.4	Linearisation	112
3.5	Linear Methods	114
3.5.1	Regularised least-squares	114
3.5.2	Optimally localised averages	116
3.6	Choosing Regularisation Weighting	120
3.7	Non-Linear Methods	123
3.7.1	The maximum entropy method	123
3.8	Optimal Mask Design as an Inverse Problem	127
4.	Local Helioseismology	131
4.1	The Data: Reduction and Analysis	131
4.1.1	Tracking, cross-correlation and filtering	132
4.1.2	Averaging and masking	139
4.2	The Forward Approach: Modelling	145
4.2.1	Hydrodynamical models with radiation	145
4.2.2	The influence of magnetic fields	147
4.2.2.1	Dynamo action	149
4.2.3	Turbulence	152
4.2.4	Wave propagation in inhomogeneous media	156
4.2.4.1	Example I: Scattering on a sphere in a homogeneous medium	157
4.2.4.2	Example II: Scattering on an infinite cylinder in a homogeneous medium	163
4.2.4.3	More general scattering problems	164
4.3	Inverse Methods	166
4.3.1	Ring diagrams	166
4.3.2	Time-distance techniques	171

4.3.3	The ray approximation	172
4.3.4	The Born approximation	177
4.3.5	The Rytov approximation	183
4.3.6	Acoustic holography	187
4.3.7	Seismology of magnetic loops	190
5.	Asteroseismology	195
5.1	The Data	196
5.1.1	Signal and noise in the observations	200
5.1.2	The mode identification problem	208
5.1.3	Irregular sampling	220
5.1.4	Non-seismic constraints	227
5.2	Modelling	230
5.2.1	The ages of stars	236
5.2.2	The composition of stars	238
5.2.3	Pulsation of stars	243
5.2.4	Excitation	245
5.2.5	Rotation	246
5.3	Inverse Methods	254
5.3.1	Time-series analysis as an inverse problem	254
5.3.2	Linear and global methods	261
5.3.3	Detecting discontinuities and kinks	268
	5.3.3.1 Example: Explicit calculations for a crude model	269
	5.3.3.2 Derivative discontinuities in realistic models	274
Appendix A	Useful Vector Formulas	279
Appendix B	Explicit Forms of Vector Operations	281
Appendix C	Useful Constants	287
	<i>Bibliography</i>	291
	<i>Index</i>	305
