Foreword	v
Preface	vii
Acknowledgments	xi
Introduction	xxiii
PART 1: PHYSICAL AND MATHEMATICAL BACKGROUND	1
1 Physical Aspects of the Motion of a Viscous Fluid	3
1.1 The Continuity, Navier–Stokes and Energy Equations	3
1.2 The Boundary Conditions	9
1.3 Non-Dimensionalization: The Reynolds and Other Dimensionless Numbers	11
1.4 Slow Viscous or Low Reynolds Number Flows: The Stokes Equation	13
1.5 The Pressure and the Vorticity	15
1.6 Streamlines and the Stream Function	17
2 The Method of Eigenfunction Expansions	21
2.1 Fourier Series	22
2.2 A Boundary Value Problem for Laplace’s Equation	25
2.3 Convergence of Fourier Series and Completeness of the Eigenfunctions	28

2.4	The Relationship of the Eigenfunction Expansions of Classical Physics to the Ones That will Arise in This Book	34
2.5	The Method of Least Squares	37
2.5.1	Curve fitting by least squares	37
2.5.2	Least squares and the expansion of an arbitrary function in terms of an infinite, complete set of functions	40
2.5.3	Least squares and Fourier series	42
2.5.4	Extensions to more difficult, non-classical situations: complex eigenfunction expansions	46
2.5.5	Eigenfunction expansions involving a single, infinite sequence of complex scalars	48
2.5.6	Eigenfunction expansions involving an infinite sequence of real scalars and an infinite sequence of complex scalars	50
2.6	Systematic Procedures for Finding the Real and Complex Roots of Transcendental Equations	53
PART 2: STEADY PLANAR FLOWS		59
3	Two-Dimensional Flow in a Rectangular Container Generated by the Motion of the Walls	61
3.1	The Field Equations, the Stream Function and Boundary Conditions	63
3.2	Symmetric and Antisymmetric Eigenfunctions for the Rectangle	65
3.3	Symmetric–Antisymmetric Decomposition in z	69
3.4	The Solution of the General Boundary Value Problem in the Rectangle	70
3.4.1	A rectangular container of infinite depth	71
3.4.2	A rectangular container of finite depth h	73
3.5	Corner Data, Some Computational Details and Accuracy	76
3.6	The Flow Field and Eddy Structure in the Lid Driven Container	87
3.6.1	The primary eddy structure	87
3.6.2	The shallow container	89

3.6.3	Corner eddies and the evolution of the primary eddies with increasing h	91
3.6.4	The pressure and vorticity fields in the container	93
3.6.5	The superiority of using velocity boundary conditions	97
3.7	Some General Conclusions on Rectangular Flow Fields	100
3.8	Other Methods of Solution	102
3.8.1	Biorthogonality and methods based on its use	102
3.8.2	Boundary integral and singularity methods	106
3.8.3	The superposition method or the method of real Fourier series	108
3.8.4	Other approaches	109
4	Similarity Solutions, Streamline Patterns and Eddies in Planar Flows	111
4.1	Separable Solutions of the Stokes Equations in Plane Polar Coordinates	112
4.2	Similarity Solutions of the Paint-Scraper Problem and One with a Free Surface	113
4.3	Flow Near a Sharp Corner: The Corner or Moffatt Eddies	115
4.4	Flow Near a Sharp Corner: Large Corner Angles	121
4.5	Corner Flows with a Source at the Vertex	123
4.6	Isolated Stagnation Points in Planar Flows	124
4.7	Viscous Flow Fields Near Points on the Boundary Where the Skin Friction Vanishes	126
4.8	Blocked Flows	129
4.9	Some Interesting Examples	131
4.10	Limitations	135
5	The Method of Embedding for Complex Geometries	138
5.1	The Embedding Method	139
5.2	The Method of Embedding for Planar Stokes Flows	141
5.2.1	A complete set of Stokes flow eigenfunctions in the rectangle	141
5.2.2	A complete set of Stokes flow eigenfunctions in the circle	144

5.2.3	Planar Stokes flow in a container of arbitrary shape	146
5.2.4	Stokes flow in an annular sector: comparison with the results of Krasnopolskaya <i>et al.</i>	150
5.3	Applications to Non-Simple Geometries	154
5.3.1	The effect of container height on the eddy structure in a round-bottomed container	154
5.3.2	A container with a trench-like bottom	155
5.3.3	Eddy structure in a container with a concave bottom	158
5.3.4	Fields in containers which are not symmetric about $x = 1/2$	161
5.4	The Strengths and Limitations of the Embedding Method	163
6	On Mathematical Issues and Some Special Two-Dimensional Flows	171
6.1	Mathematical Issues	172
6.1.1	Canonical and non-canonical problems in the semi-infinite strip	172
6.1.2	Eigenfunction expansions and completeness	173
6.1.3	Convergence of the expansions	176
6.1.4	The non-uniform nature of the Stokes equations	178
6.1.5	The physical and mathematical bases of the singular LDC problem	178
6.2	Non-Homogeneous and Discontinuous Corner Data in the Eigenfunction Method	181
6.3	The Singular LDC Problem in the Rectangular Geometry	183
6.4	Stokes Flow in Other Special Geometries	187
6.4.1	The double lid driven container	190
6.4.2	Flow in an annulus and in an annular sector	194
6.4.3	Flow in an infinite wedge driven by belts on the sidewalls	196
6.4.4	Meniscus roll coating and stress free sidewalls: real eigenvalues	200
6.4.5	Cusped interfaces in low Reynolds number flows	203

7	Planar Convective Flows	207
7.1	The Field Equations, Non-Dimensionalization and the Boussinesq Approximation	210
7.2	Planar Natural and Mixed Convection in Rectangular Containers	213
7.2.1	The case where the lid is heated and the bottom is cooled: analysis	213
7.2.2	The case where the lid is heated and the bottom is cooled: some results	216
7.2.3	Convection fields with other wall heating protocols	220
7.3	Thermal Convection Involving a Free Surface	222
7.4	Thermocapillary or Marangoni Flows	230
PART 3: STEADY THREE-DIMENSIONAL FLOWS		237
8	Some General Features of Three-Dimensional Flows	239
8.1	Three-Dimensional Flows	239
8.2	A Useful General Solution for the Stokes System	240
8.3	Other General Solutions of the Stokes Equations	242
8.4	An Atypically Simple Three-Dimensional Field: Eddies in an Infinite Channel	244
8.5	Critical Points, Limit Cycles and Vortices in Three-Dimensional Flows	250
9	Three-Dimensional Stokes Flow in a Cylinder of Circular Section	258
9.1	The Governing Equations	259
9.2	The Derivation of the Vector Eigenfunctions	260
9.3	Expansion of the Field in Terms of the Vector Eigenfunctions	264
9.4	The Flow Field in the Cylinder	267
9.4.1	The flow field in a deep cylinder	267
9.4.2	The primary eddy structure in the cylinder and the corner eddies	269
9.4.3	Corner eddy merger and the evolution of the primary eddies with h	273
9.5	Concluding Remarks	279

10	Three-Dimensional Flow in a Cylindrical Liquid Bridge	280
10.1	Analysis of the Three-Dimensional Field	281
10.2	The Field Structure When the Bottom Wall Alone Moves	285
10.3	Flow Fields Generated When Both Boundaries Move	292
10.4	Summary, Implications and Extensions	298
11	Three-Dimensional Corner Eddies	299
11.1	Moffatt Eddies in the Cone	302
11.1.1	Similarity solutions and the inner eigenfunctions	303
11.1.2	Moffatt eddies	309
11.1.3	The flow in the lid driven cone	316
11.1.4	The outer eigenfunctions and the flow field in a conical container	318
11.1.5	Flow fields in the cone and in the conical container	319
11.2	Corner Eddies in the Wedge	323
11.2.1	The work of Sano and Hasimoto	325
11.2.2	The studies of Moffatt and collaborators	329
11.2.3	The field near the corner of a semi-wedge	336
11.3	Summary of Results	344
12	Stokes Flow in a Rectangular Container	345
12.1	The Nature of the Difficulties in This Geometry	346
12.2	The Analysis of the Field in the Container	348
12.2.1	The z -symmetric/antisymmetric decomposition	348
12.2.2	A new set of z -antisymmetric three-dimensional eigenfunctions in Cartesian coordinates	349
12.2.3	The solution of the boundary value problem for the z -antisymmetric field	356
12.2.4	The boundary value problem for the z -symmetric field	359
12.2.5	The calculation of the field in the container	360

12.3	The Nature of the Recirculating Flow Field in the Container	360
12.3.1	Some comparisons with other work	362
12.3.2	Fields in containers of spanwise aspect ratio $\mathcal{A} = 1$	363
12.3.3	Containers of spanwise aspect ratio $\mathcal{A} = 3$	368
12.3.4	A very large aspect ratio container, $\mathcal{A} = 6$	371
12.3.5	A case where the lid speed vanishes for $y > y_0$, $\mathcal{A} = 6$	373
13	Three-Dimensional Convection in a Cylindrical Container	377
13.1	Introduction	377
13.2	Analysis	378
13.2.1	The field equations and the solution strategy	378
13.2.2	The temperature field	381
13.2.3	A solution of the inhomogeneous Stokes equations	381
13.2.4	The radial eigenfunctions: Stokes flow eigenfunctions satisfying homogeneous boundary conditions on the cylindrical sidewall	382
13.2.5	Axial eigenfunctions: Stokes flow eigenfunctions satisfying homogeneous boundary conditions on the flat endwalls	384
13.2.6	Some useful Stokes flow fields	386
13.2.7	The solution of the natural convection problem	387
13.3	Natural Convective Flow Fields	388
13.4	Some Other Applications of the Above Extensions	394
PART 4:	UNSTEADY FLOWS	397
14	Slow Unsteady Viscous Flows	399
15	The Oscillating Lid Driven Container	404
15.1	Formulation of the Unsteady Problem	404
15.2	The Eigenvalue Problem and the Distribution of the Eigenvalues	406

15.3	The Eigenfunction Expansion for the Velocity Field	410
15.4	Oscillatory Flow Fields	412
15.4.1	The periodic field in an infinitely deep container	413
15.4.2	The general eddy structure in containers of finite depth	415
15.4.3	The mechanism for the reversal of the general circulation	419
15.4.4	The formation and decay of the second primary eddy, $h = 1.5$	422
15.4.5	Corner eddies	423
15.4.6	Moderate Reynolds numbers	424
15.5	Applications	425
16	Mixing by Advection in Lid Driven Flows	
	(by R. Kidambi)	428
16.1	Computation of Velocity Fields	430
16.2	Particle Trajectories and Their Computation	431
16.3	Mixing Estimates	432
16.4	Mixing in a DLDC	433
16.4.1	Experiment	435
16.4.2	Computation	436
16.4.3	Mixing calculations	437
	16.4.3.1 Case C_1	437
	16.4.3.2 Case C_2	438
16.5	Mixing Calculations with Inertial Effects	443
16.6	Summary	445
17	Viscous Wave Attenuation (by R. Kidambi)	446
17.1	Fluid Interfaces, Free Surfaces and Contact Lines	446
17.2	Formulation of the Problem	447
17.3	The Solution	450
	17.3.1 The case of infinite depth	450
	17.3.1.1 An eigenvalue problem for Ω	451
	17.3.2 The case of finite depth	454
17.4	Results and Discussion	455
	17.4.1 The case of infinite depth	455
	17.4.2 The case of finite depth	459

PART 5: EXTERNAL FLOWS	471
18 External Flows Past Bodies	473
18.1 The Oseen Equations for External Flows	474
18.2 Different View Points Regarding the Use of the Oseen Equations	476
18.3 The Embedding Method for External Flows	478
19 Planar Bluff Body Flows at Low Reynolds Numbers	480
19.1 The Flow Past a Circular Cylinder	481
19.1.1 The Filon eigenfunctions	481
19.1.2 The flow past a stationary circular cylinder	486
19.1.3 The lift and drag coefficients	488
19.1.4 The rotating cylinder in uniform flow	490
19.2 Flows Past Cylindrical Bluff Bodies of Essentially Arbitrary Shape	495
19.3 The Flow Past an Ellipse	498
19.4 Flows Past More Complex Shapes	500
20 Low Reynolds Number Flows Past Streamlined Bodies	505
20.1 The Flow Past an Elliptic Cylinder at an Angle of Attack	506
20.1.1 Elliptic coordinates	506
20.1.2 Formulation in elliptic coordinates	508
20.1.3 Separable solutions in elliptic coordinates and solutions aperiodic in η	509
20.1.4 An expansion for the field in terms of the Hasimoto eigenfunctions	512
20.1.5 Viscous flow past elliptic sections	515
20.2 Aerofoils in Viscous Flow	521
20.2.1 A symmetrical section: the NACA 0012 aerofoil	521
20.2.2 A cambered section: the NACA 4412 aerofoil	528
20.3 Further Directions	532

Appendix 1: Spherical Harmonics	534
Appendix 2: Mathieu Functions	536
Appendix 3: Aerofoil Sections	543
Bibliography and Author Index	545
Subject Index	557
