

CONTENTS

Preface	v
1. Experimental Studies of Stiffened Composite Panels under Axial Compression, Torsion and Combined Loading <i>H. Abramovich, Technion-Israel Institute of Technology, Israel</i>	1
1.1 Introduction	1
1.2 Testing of stiffened composite panels under axial compression	4
1.3 Testing of stiffened composite panels under torsion and combined torsion and axial compression	8
1.4 Experimental results – Axial compression	15
1.5 Experimental results – Torsion and combined loading	21
1.6 Conclusions	35
1.7 Acknowledgements	36
1.8 References	37
2. Buckling and Postbuckling Tests on Stiffened Composite Panels and Shells <i>C. Bisagni, Politecnico di Milano, Italy</i>	39
2.1 Introduction	39
2.2 Test specimens	42
2.3 Test equipment	46
2.4 Test procedures and measurements	48
2.5 Results on shells	50
2.6 Results on panels	58
2.7 Conclusions	61
2.8 Acknowledgments	63
2.9 References	63

3.	Mode-Jumping in Postbuckling Stiffened Composite Panels	65
	<i>B. G. Falzon, Imperial College London, United Kingdom</i>	
3.1	Introduction	65
3.2	Experimental observations of mode-jumping	68
	3.2.1 Hat-stiffened panel (I)	68
	3.2.2 I-stiffened panel	71
3.3	Numerical analysis	79
	3.3.1 Background	79
	3.3.2 The arc-length method	80
	3.3.3 Dynamic methods	81
	3.3.4 An automated combined quasi-static/ pseudo-transient method	84
3.4	Finite element modelling	87
	3.4.1 I-stiffened panel	87
	3.4.2 Hat-stiffened panel (II)	90
3.5	Concluding remarks	96
3.6	Acknowledgement	97
3.7	References	97
4.	The Development of Shell Buckling Design Criteria Based on Initial Imperfection Signatures	99
	<i>M. W. Hilburger, NASA Langley Research Centre, USA</i>	
4.1	Introduction	100
4.2	Test specimens, imperfection measurements, and tests	103
	4.2.1 Test specimens	103
	4.2.2 Imperfection measurements	105
	4.2.3 Test apparatus and tests	108
4.3	Finite-element models and analyses	109
	4.3.1 Finite-element models	109
	4.3.2 Nonlinear analysis procedure	110
4.4	Developing experimentally validated high-fidelity models	110
	4.4.1 High-fidelity analysis models	110
	4.4.2 Typical high-fidelity analysis results	114

4.5	Analysis-based high-fidelity design criteria	124
4.5.1	Manufacturing imperfection signature	125
4.5.2	Response of compression-loaded shells	129
4.5.3	Response of shells subjected to combined axial compression and torsion	132
4.6	Concluding remarks	136
4.7	Acknowledgements	137
4.8	References	138
5.	Stability Design of Stiffened Composite Panels – Simulation and Experimental Validation	141
	<i>A. Kling, DLR German Aerospace Centre, Germany</i>	
5.1	Introduction	141
5.2	Stability design scenario	142
5.3	Design of the test structures	144
5.4	Experiment	146
5.4.1	Test structure	149
5.4.2	Preparation of the test structure	151
5.4.3	Test	153
5.4.4	Results	154
5.5	Analysis	157
5.5.1	Numerical methods	157
5.5.2	Analysis procedure	160
5.5.3	Finite element model	162
5.5.4	Results	164
5.6	Validation	166
5.6.1	Introduction	167
5.6.2	Validation approach	168
5.6.3	Results	169
5.6.4	Transferability	173
5.7	Conclusions and outlook	174
5.8	References	175

6.	Anisotropic Elastic Tailoring in Laminated Composite Plates and Shells	177
	<i>P. M. Weaver, University of Bristol, United Kingdom</i>	
6.1	Introduction	177
6.2	Mechanics of Anisotropic plates	181
6.2.1	Introduction	181
6.2.2	Initial buckling of anisotropic plates	182
6.2.3	Significance of lamination parameters	187
6.2.4	Postbuckling of anisotropic plates	188
6.2.5	Nondimensional parameters-bounds on values of parameters	190
6.3	Plate buckling	192
6.3.1	Introduction	192
6.3.2	Combined loading	193
6.3.3	Development of model	195
6.3.4	Compression loading	197
6.3.5	Biaxial loading	204
6.3.6	Uniform shear loading	210
6.3.7	Postbuckling of plates under compression loading	217
6.4	Cylindrical shells under compression loading	220
6.5	Conclusions	222
6.6	Acknowledgements	222
6.7	References	222
7.	Optimisation of Stiffened Panels using Finite Strip Models	225
	<i>R. Butler & W. Liu, University of Bath, United Kingdom</i>	
7.1	Introduction	225
7.2	Buckling analysis	228
7.3	Optimum design strategy	229
7.3.1	Panel level optimisation	231
7.3.2	Laminate level optimisation	232
7.3.3	Convergence test	235

7.4	Results	236
7.4.1	Validation of strip method for local buckling of composite stiffened panels	236
7.4.2	Validation of an optimum design	242
7.4.3	Optimisation of composite wing cover panels	248
7.5	Concluding remarks	255
7.6	Acknowledgements	256
7.7	References	256
8.	Stability of Tubes and Pipelines	259
	<i>H. A. Rasheed & S. A. Karamanos, Kansas State University, USA</i>	
8.1	Introduction	259
8.2	Stability of elastic isotropic cylinders	260
8.2.1	Stability of elastic cylinders under uniform external pressure	260
8.2.2	Stability of pressurized long elastic cylinders under bending	268
8.3	Stability of metal tubes and pipelines	273
8.3.1	Numerical finite element technique	274
8.3.2	Buckling of inelastic cylinders under external pressure	279
8.3.3	Stability of inelastic cylinders under bending and pressure	281
8.3.4	Propagating buckles in metal pipelines	285
8.4	Stability of composite tubes and pipelines	288
8.4.1	Stability of anisotropic laminated rings and long cylinders	288
8.4.2	Stability of delaminated long cylinders under external pressure	296
8.5	References	306

9. Imperfection-Sensitive Buckling and Postbuckling of Spherical Shell Caps	309
<i>S. Yamada & M. Uchiyama, Toyohashi University of Technology, Japan</i>	
9.1 Introduction	309
9.2 Theoretical background: mixed finite element analytical method	311
9.3 Experimental background: initial imperfection measurement	316
9.4 Agreement on buckling loads	318
9.5 Prebuckling deflection modes near the buckling points	322
9.6 Postbuckling deflection behaviour at the static equilibrium state	323
9.7 Vibration behaviour just after buckling	329
9.8 Conclusions	333
9.9 References	333
10. Nonlinear Buckling in Sandwich Struts: Mode Interaction and Localization	335
<i>M. A. Wadee, Imperial College London, United Kingdom</i>	
10.1 Introduction	335
10.2 Nonlinear buckling model	337
10.2.1 Overall buckling	338
10.2.2 Interactive buckling	340
10.2.3 Linear eigenvalue analysis	348
10.2.4 Perfect isotropic struts with soft cores	348
10.3 Special perfect cases	352
10.3.1 Core orthotropy	352
10.3.2 Face–core delamination	355
10.3.3 Combined loading	360
10.4 Imperfection sensitivity	361
10.4.1. Doubly-symmetric panels	361
10.4.2 Monosymmetric panels	367

10.5	Concluding remarks	371
10.6	Acknowledgements	373
10.7	References	373
11.	The Boundary Element Method for Buckling and Postbuckling Analysis of Plates and Shells	375
	<i>M. H. Aliabadi & P. M. Baiz, Imperial College London, United Kingdom</i>	
11.1	Introduction	375
11.2	Basic definitions of shear deformable plates and shallow shells	378
11.2.1	Kinematic equations	378
11.2.2	Equilibrium equations	379
11.2.3	Constitutive equations	380
11.2.4	Large deflection theory	381
11.3	Boundary element method for shear deformable plates and shallow shells	382
11.3.1	Rotations and out of plane integral equations	383
11.3.2	In plane displacement integral equations	384
11.4	Governing integral equations for linear buckling	384
11.4.1	Integral equations for in plane stresses	385
11.4.2	Integral formulation for the linear buckling problem	385
11.5	Multi region formulation	387
11.6	Governing integral equations for postbuckling	389
11.6.1	Nonlinear rotations and out-of-plane integral equations	390
11.6.2	Nonlinear in-plane integral equations	390
11.6.3	Domain nonlinear terms	391
11.7	Numerical implementation	392
11.7.1	Discretization	393
11.7.2	Dual Reciprocity Method (DRM)	393
11.7.3	Treatment of the integrals	394

11.8	Numerical procedure	395
11.8.1	Linear buckling (eigenvalue)	395
11.8.2	Postbuckling	397
11.9	Numerical examples	399
11.9.1	Linear buckling of curved plates	400
11.9.2	Linear buckling of channel sections	400
11.9.3	Point load at the crown of a cylindrical shallow shell	401
11.10	Conclusions	403
11.11	Acknowledgments	404
11.12	References	409
12.	Progressive Failure in Compressively Loaded Composite Laminated Panels: Analytical, Experimental and Numerical Studies	413
	<i>S. Basu, A. M. Waas & D. R. Ambur, University of Michigan, USA</i>	
12.1	Introduction	414
12.2	Macroscopic model for kink banding instabilities in fiber composites	417
12.2.1	Progressive failure analysis using schapery theory	418
12.2.2	Numerical implementation via the finite element (FE) method	424
12.2.3	Numerical predictions	425
12.2.4	Results and discussion	429
12.3	Description of experimental studies on composite laminated panels	434
12.3.1	Experimental details of stitched double notched panels (DNPs)	434
12.4	Progressive failure analysis of multidirectional composite laminated panels	436
12.4.1	Numerical simulations — Modeling details	437
12.4.2	Results for the stitched panels — DNPs	440

12.5	Concluding remarks	450
12.6	References	451
13.	Micro- and Meso-Instabilities in Structured Materials and Sandwich Structures	453
	<i>T. Daxner, D. H. Pahr & F. G. Rammerstorfer, Vienna University of Technology, Austria</i>	
13.1	Introduction	453
13.2	Instabilities in micro-structured materials	454
13.2.1	Micro-structured materials — Introduction	454
13.2.2	Micro-structured materials — Methods	455
13.2.3	Open-cell topologies	458
13.2.4	Closed-cell foams	462
13.2.5	Mixed topologies	469
13.2.6	Micro-structured materials — Summary	473
13.3	Instabilities in sandwich structures	474
13.3.1	Sandwiches with homogeneous or homogenised cores	474
13.3.2	Sandwiches with honeycomb cores	482
13.3.3	Corrugated board	489
13.4	Conclusions and summary	492
13.5	References	493
	Index	497
