Preface	v
Preface for Second Edition	ix
Part I. Preliminaries	1
1. Solid Continuum Mechanic	3
1.1 Spring Problem	4
1.2 Pole Problem	6
1.3 Continuum Problem	8
2. Finite Element Method	13
2.1 Overview of FEM	14
2.2 Discretisation of Function	18
2.3 Formulation of FEM	21
2.4 Major Numerical Techniques Used in FEM	24
2.4.1 Shape function	25
2.4.2 Isoparametric element	26
2.4.3 Gauss integral	27
2.5 Algorithm Used to Solve A Matrix Equation of FEM	28
2.5.1 Direct solvers	29
2.5.2 Iterative solvers	31
2.5.3 Algorithms used to solve a non-linear equation	33
3. Stochastic Modeling	37
3.1 Formulation of A Stochastic Variational Problem	38
3.2 Analysis Methods of A Stochastic Variational Problem	41
3.2.1 Bounding medium analysis	42
3.2.2 Spectral method	44

Part II. Strong Ground Motion	49
4. The Wave Equation for Solids	51
4.1 Basics of the Wave Equation	52
4.2 Analytic Solutions of Particular Wave Problems	57
4.2.1 Out-of-plane shear wave	58
4.2.2 In-plane wave	62
4.2.3 Plane wave in three-dimensional setting	66
4.3 Numerical Analysis of the Wave Equation	69
4.3.1 Algorithms used for time integration	70
4.3.2 Stability of time integration	72
5. Analysis of Strong Ground Motion	75
5.1 Stochastic Modeling of Underground Structures	76
5.2 Bounding Medium Theory	78
5.3 Singular Perturbation Expansion	81
5.4 Formulation of Macro-Micro Analysis Method	83
5.5 Verification of Macro-Micro Analysis Method	86
5.5.1 Validation of bounding medium theory	87
5.5.2 Validation of singular perturbation expansion	91
5.5.3 Validation of macro-micro analysis method	96
6. Simulation of Strong Ground Motion	101
6.1 Summary of Macro-Micro Analysis Method	103
6.2 VFEM for Macro-Analysis and Micro-Analysis	105
6.2.1 VFEM	106
6.2.2 VFEM for macro-analysis	107
6.2.3 VFEM for micro-analysis	111
6.2.4 Link from macro-analysis to micro-analysis	115
6.3 Simulation of Actual Earthquakes	117
6.3.1 Modeling	117
6.3.2 Comparison of synthesised waveform with observed waveform	122
6.3.3 Distribution of simulated strong ground motion	123
6.3.4 The comparison of three-dimensional analysis and one-dimensional analysis	130

Part III. Faulting	135
7. Elasto-Plasticity and Fracture Mechanics	137
7.1 Numerical Analysis of Failure	137
7.2 Elasto-Plasticity	139
7.3 Fracture Mechanics	142
8. Analysis of Faulting	147
8.1 NL-SSFEM	152
8.1.1 SSFEM	152
8.1.2 NL-SSFEM	155
8.1.3 Bounding medium approximation	156
8.1.4 Formulation of NL-SSFEM	158
8.2 Numerical Algorithms of NL-SSFEM	160
8.2.1 Matrix Jacobi method	161
8.2.2 Standardised KL expansion	162
8.2.3 Numerical perturbation during analysis of stochastic model	163
8.3 Validation of NL-SSFEM Simulation	165
8.4 Example of Fault Simulation of NL-SSFEM	170
9. Simulation of Faulting	179
9.1 Problem Setting for Fault Simulation	180
9.1.1 Input data	181
9.1.2 Output results	182
9.2 Reproduction of Model Experiments	184
9.2.1 Simulation of two-dimensional model experiment	184
9.2.2 Simulation of three-dimensional model experiment	190
9.3 Simulation of Actual Faults	202
9.3.1 Simulation of the Nojima Fault	203
9.3.2 Parametric study of stochastic parameters	211
9.3.3 Simulation of the Chelungpu Fault	214
10. BEM Simulation of Faulting	221
10.1 Problem Setting for Fault Simulation	223
10.1.1 Perturbation expansion of field variables with respect to crack extension	224

10.1.2	Crack driving forces	226
10.1.3	Solution of crack path problem	229
10.2	Formulation of Boundary Element Method	231
10.3	Verification of Analysis Method	234
10.3.1	Use of analytic solution	234
10.3.2	Use of numerical computation	238
10.4	Reproduction of Model Experiments	244
10.4.1	Simulation of model experiment of [Bray <i>et al.</i> (1994)]	245
10.4.2	Simulation of model experiment of [Tani (1994)]	248
Part IV. Advanced Topics		251
11.	Integrated Earthquake Simulation	253
11.1	System of Integrated Earthquake Simulation	254
11.2	GIS	258
11.3	Construction of Computer Model	260
11.3.1	Construction of ground structure model	260
11.3.2	Construction of residential building model	264
11.4	Example of Integrated Earthquake Simulation	267
11.4.1	Modeling	268
11.4.2	Strong ground motion simulation	270
11.4.3	Structure response simulation	273
12.	Unified Visualisation of Earthquake Simulation	277
12.1	System for Unified Visualisation	279
12.1.1	Mediator	280
12.1.2	Mediator maker	283
12.2	IES for Unified Visualisation	285
12.3	Example of Unified Visualisation	290
13.	Standardisation of Earthquake Resistant Design	295
13.1	Standardisation of Description Style	296
13.2	Description of Flow Chart in Terms of Object	298
13.2.1	Reconstruction of flow chart for general earthquake resistant designs	298
13.2.2	Reconstruction of flow chart for actual earthquake resistant design code	305
13.3	Example of Standardisation	311

14.	Multi-Agent Simulation for Evacuation Process Analysis	317
14.1	Evacuation Process Analysis	318
14.2	Numerical Methods for Evacuation	
	Process Analysis	319
14.2.1	Simulation of physical model	320
14.2.2	Cellular automata	320
14.2.3	MAS (Multi-Agent Simulation)	321
14.3	Design of Agent and Environment for Multi-Agent Simulation	322
14.4	Measurement of Individual Walking Speed by Image Analysis	326
14.4.1	Walking speed distribution in crowded situation	327
14.4.2	Individual speed escaping from tsunami	330
14.4.3	Individual speed evacuating during earthquake	331
14.5	Construction of Environment Using Digital Data	334
14.5.1	Methodology of automatic data conversion	335
14.5.2	Automatic data conversion for GIS	336
14.5.3	Example of automatic data conversion for GIS	337
14.5.4	Automatic data conversion for CAD data	338
14.5.5	Example of automatic data conversion of CAD data	340
14.6	Examples of Multi-Agent Simulation for Evacuation Process Analysis	342
14.6.1	Road network	343
14.6.2	Subway station	347
14.6.3	Underground shopping mall	352
Appendix A.	Earthquake Mechanisms	359
A.1	Plate Tectonics and Active Faults	359
A.2	Earthquake as Wave Propagation	366
A.2.1	Determination of input strong ground motion according to earthquake scenario	366
A.2.2	Soil-structure interaction	368
Appendix B.	Analytical Mechanics	371

Appendix C. Numerical Techniques of Solving Wave Equation	375
C.1 Explicit Method and Implicit Method	376
C.2 Analysis of Wave Propagation Using FEM	379
C.3 Absorption Boundary	382
Appendix D. Unified Modeling Language	387
Bibliography	393
Index	415
