Preface

xv

A. Overview and Outlook

1. The Route of Anaerobic Waste (Water) Treatment toward Global Acceptance	1
<i>G. Lettinga</i>	
1 Introduction	1
2 Roots of Modern High Rate AnWT	3
2.1 Historical aspects of PuSan with AnDi system (e.g., McCarty, 2001)	3
2.2 Historical aspects of high-rate AnWT	4
3 Development of Anaerobic Upflow Sludge Bed Systems	5
3.1 Conventional UASB (Lettinga 1995)	5
3.2 The EGSB system	8
3.3 Other high rate reactor designs	9
4 Place of AnWT in EP	9
5 What Could the Future Bring?	11
References	12

B. Full-Scale Applications

2. Developments of New Anaerobic Treatment Technology in France	17
<i>R. Moletta</i>	
1 Introduction	17
2 New Anaerobic Treatment Technologies	18
2.1 Anaerobic moving bed biofilm reactor (AMBBR)	18
2.2 Floating anaerobic filter reactor PROVEO	19
2.3 Anaerobic membrane bioreactor	23
2.4 Organic solid waste digestion: the ERGENIUM TM technology	25
2.5 Control of biogas quality	29
References	33

3.	Applications and New Developments of Biogas Technology in Japan	35
	<i>Yu-You Li and Takuro Kobayashi</i>	
1	Introduction	35
2	Applications of Biogas Technology in Japan	36
2.1	Sewage sludge	36
2.2	Night soil (human waste)	38
2.3	Livestock waste	40
2.4	Municipal solid wastes	46
2.5	Wastewater treatment	51
3	New Developments in Biogas Technology in Japan	52
3.1	Anaerobic membrane reactor	52
3.2	Two-phase fermentation for hydrogen and methane production	54
3.3	Biological desulfurization of biogas	55
	References	57
4.	Anaerobic Sewage Treatment using UASB Reactors: Engineering and Operational Aspects	59
	<i>J. B. Van Lier et al.</i>	
1	Introduction	59
2	Reactor Size and Shape	66
2.1	Size	67
2.2	Basic shape	67
3	Influent Distribution System	68
3.1	Final distribution box	68
3.2	Blockages to inlet pipes	70
3.3	Inlet pipes diameter	72
4	Gas–Liquid–Solid (GLS) Separator	73
4.1	GLS separator designs	74
4.2	Materials of construction	75
4.3	Deflector type	76
5	Effluent Collection	77
6	Sludge Withdrawal and Sludge Sampling	78
6.1	Sludge withdrawal	78
6.2	Sludge sampling	79
7	Scum Removal	80
7.1	Scum in the settler section	81
7.2	Scum in the gas hood	82
8	Reactor Covers and Emission Prevention	82
9	Future Outlook: Treatment of Concentrated Sewage	84
10	Concluding Remarks	86
	References	87

5. Application of UASB Technology for Sewage Treatment with a Novel Post-treatment Process 91
S. Uemura and H. Harada

1 Introduction 91

2 Treatment of Sewage by the UASB Process 93

2.1 Performance of full-scale UASB reactors under moderate to tropical conditions 93

2.2 Application of UASB to sewage treatment under psychrophilic conditions 95

2.3 State-of-the-art of sewage treatment by UASB in India 97

2.4 Post-treatment for UASB-treated sewage 100

3 Down-Flow Hanging Sponge Process 103

3.1 Basic concept of DHS 103

3.2 History of DHS evolution 104

3.3 Characteristics of DHS sludge yield 105

3.4 Performance of a full-scale DHS G2 plant in India 107

4 Conclusion 109

References 109

C. Emerging Technologies

6. Anaerobic Granulation and Granular Sludge Reactor Systems 113
J.-H. Tay et al.

1 Introduction 113

2 Granulation 114

2.1 Granulation with methane production 114

2.2 Granulation with hydrogen production 117

3 Granular Sludge Reactors 123

3.1 Upflow anaerobic sludge blanket (UASB) reactor 123

3.2 Expanded granular sludge bed (EGSB) reactor 126

3.3 Hybrid anaerobic reactors 127

3.4 Anaerobic continuous stirred tank reactor (CSTR) 127

3.5 Anaerobic baffled reactor (ABR) 129

3.6 Internal circulation (IC) reactor 129

3.7 Anaerobic sequencing batch reactor (ASBR) 129

3.8 Anaerobic migrating blanket reactor (AMBR) 130

4 Future Trends 130

References 131

7. Anaerobic Membrane Reactors 137
D. C. Stuckey

1 Introduction 137

2 History 138

3	Membrane Configuration	138
3.1	Pressure-driven external cross-flow membrane	138
3.2	Vacuum-driven submerged membrane immersed directly into the reactor	141
4	Membrane Pore Size and Composition	141
5	Membrane Fouling and Flux	143
5.1	Soluble organics	145
5.2	Colloidal particles	145
5.3	Inorganic fouling	146
5.4	Measures to manage membrane fouling	146
6	Effect of Operating Parameters	149
6.1	Operating temperature	149
6.2	Hydraulic retention time and solids retention time	151
6.3	Microbial ecology of anaerobic membrane reactors	152
7	Application to Synthetic and Industrial Wastewaters	153
8	Potential Application for Anaerobic Membrane Reactors	154
9	Research Needs and Conclusions	154
	References	156
8.	Anaerobic Baffled Reactor (ABR) for Wastewater Treatment	163
	<i>D. C. Stuckey</i>	
1	Introduction	163
2	Reactor Development	164
3	Reactor Hydrodynamics	165
3.1	Flow patterns	165
3.2	Effect of effluent recycle	166
4	Reactor Performance	167
4.1	Start-up	167
4.2	Treatment applications	168
5	Biomass Characteristics and Retention Capabilities	172
5.1	Bacterial populations	172
5.2	Granulation and floc sizes	173
6	Soluble Microbial Products (SMPs)	174
7	Modelling	176
8	Full-scale Experience	178
9	Conclusions	179
	References	180
9.	Anaerobic Treatment of Phenolic Wastewaters	185
	<i>D. Liang and H.H.P. Fang</i>	
1	Introduction	185
2	Phenols Inhibition Effect on the Anaerobes and Restoration of the Bioactivity	186
2.1	Phenols inhibition effect	186
2.2	The tolerance of anaerobes to phenolic toxicity	186
2.3	Recovery of bioactivity after inhibition	187

3	Reactors Treatment of Phenolic Wastewater	187
3.1	UASB	188
3.2	Hybrid UASB	188
3.3	EGSB	188
3.4	Granular activated carbon (GAC)-fluidized bed reactor	192
3.5	Fixed-film reactor (anaerobic filter)	192
3.6	Other types of reactor	192
4	Affecting Factors for the Anaerobic Wastewater Treatment of Phenols	193
4.1	Hydraulic retention time (HRT)	193
4.2	Loading shock	193
4.3	Temperature	194
4.4	Effluent recirculation	195
4.5	Co-substrate	195
4.6	Degradation of mixed phenols	197
5	Phenols-degrading Granular Sludge	198
6	Anaerobic Phenols-degrading Microorganisms	199
7	Anaerobic Degradation Pathway of Phenols	200
	References	201
10.	Application of Molecular Methods for Anaerobic Technology	207
	<i>T. Zhang</i>	
1	Introduction	207
2	Extraction of Nucleic Acids	209
3	Selection of Biomarker	211
4	Polymerase Chain Reaction (PCR)	212
5	Characterization of Microbial Community	213
5.1	Cloning	213
5.2	Diversity estimation	215
5.3	Metagenome	215
6	Fingerprint Methods	216
6.1	DGGE	216
6.2	T-RFLP	217
7	FISH	218
7.1	Introduction	218
7.2	Quantification using FISH	219
7.3	Variation of FISH	219
7.4	Advantages and disadvantages of FISH	220
8	Microbial Quantification Using qPCR	221
9	Applications of Molecular Techniques in Anaerobic Technology Studies	224
9.1	Identification of new species	224
9.2	Characterization of microbial compositions	224
9.3	Visualization of structure of granular sludge	227
9.4	Quantification of various microbial groups	227
9.5	Evaluation of degradation of refractory compounds	229

9.6	Investigation of microbial communities in anaerobic digestion of special wastewater	230
10	Perspectives	232
	References	233
11.	Application of Mathematical Models to Anaerobic Digestion Process	241
	<i>H. Yasui and R. Goel</i>	
1	Classification of Mathematical Models	241
2	Essentials of Mechanistic Models	243
2.1	State Variables	243
2.2	Formulation of conservation equations	243
2.3	Selection of model units	244
2.4	Development of model structure	245
2.5	Model definition using Petersen matrix	246
3	Considerations in Model Application	249
3.1	Stoichiometric and kinetics parameters	250
3.2	Integration of ASM and ADM1 models	255
	References	256
 D. New Developments		
12.	Anaerobic Digestion of Lignocellulosic Wastes by Rumen Microorganisms: Chemical and Kinetic Analyses	259
	<i>Z.-H. Hu et al.</i>	
1	Introduction	259
2	Composition of Lignocelluloses	260
3	Chemical Analyses	261
3.1	AFM analysis	261
3.2	FTIR analysis	262
3.3	XPS analysis	263
3.4	GC/MS analysis	264
3.5	XRD analysis	264
4	Chemical Analysis on Anaerobic Digestion of Wheat Straw by Rumen Microorganisms	264
4.1	Materials and methods	264
4.2	Results of chemical analysis	265
4.3	Discussion	270
5	Kinetics Analysis	272
5.1	Gompertz model	273
5.2	Monod model	274
6	Conclusions	275
	References	275

13. Enzymatic Treatment of Lignocellulosic Wastes for Anaerobic Digestion and Bioenergy Production	279
<i>G. D. Saratale et al.</i>	
1 Introduction	279
2 Structure and Composition of Plant Cell Wall	281
2.1 The cellulose component	282
2.2 The hemicellulose component	282
2.3 The lignin component	283
2.4 Other cell wall components	283
3 Lignocellulose-Degrading Microorganisms	283
3.1 Cellulose-degrading fungi	283
3.2 Cellulose-degrading bacteria	284
3.3 Bacterial cellulosome	285
4 Cellulolytic Enzymes	286
4.1 Cellulose-degrading enzymes	286
4.2 Hemicellulose-degrading enzymes	290
4.3 Lignin-degrading enzymes	291
4.4 Pectin-degrading enzymes	292
5 Production and Utilization of Cellulolytic Enzymes	292
5.1 Recent development in the productions of cellulolytic enzymes	292
5.2 Immobilization of cellulolytic enzymes for repeated uses	295
6 Enzymatic Pretreatment of Cellulosic Materials	296
6.1 Direct application of cellulolytic enzymes	297
6.2 Microbial hydrolysis of cellulosic materials	297
7 Anaerobic Treatment and Bioenergy Production from Lignocellulosic Wastes	298
7.1 Cellulosic hydrogen production	299
7.2 Cellulosic ethanol production	300
8 Conclusion	301
References	302
14. Biohydrogen Production by Fermentation and Microbial Electrolysis Cells	309
<i>N. Q. Ren et al.</i>	
1 Introduction	309
2 Dark-fermentative Hydrogen Production Process and Controlling Factors	310
2.1 Dark-fermentative hydrogen production process	310
2.2 Startup and controlling factors of dark-fermentative hydrogen production	311
2.3 Pilot and full-scale hydrogen production from wastewater	313
2.4 Biohydrogen production from complex organic wastes	314
2.5 Hydrogen production coupling with methane production	314
3 Photo-fermentative Hydrogen Production Process and Controlling Factors	316
3.1 Photo-fermentative hydrogen production	317
3.2 Controlling factors of photo hydrogen production	317

3.3	Combination of dark- and photo-fermentation	319
4	Microbial Electrolysis Cells for Hydrogen Production	320
4.1	Principle and architecture of microbial electrolysis cells	320
4.2	MEC operation	321
4.3	Hydrogen production by coupling dark-fermentation and MEC	323
5	Perspective	324
	References	325
15.	Research and Development of Biohydrogen Production in Taiwan	331
	<i>C.-Y. Lin and C.-H. Lay</i>	
1	Introduction	331
2	Anaerobic Hydrogen Fermentation	332
3	High-Rate Biohydrogen Production Technology	332
3.1	Culture enrichment technology	333
3.2	High-rate hydrogen fermentation system	335
4	Integration of Hydrogen Production and Fuel Cell for on-Line Electricity Generation	337
5	Pilot-Scale Hydrogen Fermentation System	338
6	Microbial Community	340
6.1	Bench-scale bioreactor with glucose, xylose, and starch as carbon source	340
6.2	Pilot plant reactor	341
6.3	Bacterial community analysis by real-time PCR	341
7	Conclusions	342
	References	342
16.	A Two-Stage Fermentation Process Converting Waste and Wastewater to Hydrogen and Methane	345
	<i>H.-S. Shin and D.-H. Kim</i>	
1	Introduction	345
1.1	Climate change, clean energy, and biomass	345
1.2	Hydrogen energy	346
2	Fermentative Hydrogen Production	347
2.1	Photo-driven process	348
2.2	Fermentation	348
2.3	Biomass sources for FHP and their feasibility	350
3	Two-stage Fermentation System	355
4	Future Research	357
	References	358
17.	Bio-productions of Hydrogen and Ethanol from Sugarcane	365
	<i>A. Reungsang and P. Plangklang</i>	
1	Introduction	365
2	Composition of Sugarcane Juice	366

3	Composition of Sugarcane Bagasse	366
4	Hydrogen Production	366
4.1	Hydrogen production from sugarcane juice	366
4.2	Hydrogen production from sugarcane bagasse hydrolysate	368
5	Ethanol Production	368
5.1	Ethanol production from sugarcane bagasse	370
	References	374
18.	Synthesis Gas Fermentation	379
	<i>S. Sung and P.-H. Lee</i>	
1	Introduction	379
2	Microbiology of Anaerobic Microorganisms Capable of Converting Syngas to Biofuels and Chemicals	381
2.1	Mesophiles for organic acids production	381
2.2	Mesophiles for alcohols production with the by-products of organic acids	381
2.3	Mesophiles for hydrogen and poly- β -hydroxyalkanoate (PHA) production	382
2.4	Thermophiles for hydrogen and organic acid production	383
3	Metabolic Pathways of Syngas Fermentation	383
3.1	Acetyl-CoA pathway of bacteria for the formation of organic acids and alcohols	383
3.2	Acetyl-CoA pathway of bacteria for the formation of hydrogen	384
4	Carbon Monoxide Gas–Liquid Mass Transfer	385
4.1	Determination of CO gas–liquid mass transfer	385
4.2	Stirred tank reactor	385
4.3	Other fermenters	385
4.4	Hollow fiber membrane fermenter	386
5	Gas–Liquid Mass Transfer Rates in Syngas Fermentation	386
6	Performances of Syngas Fermentation for Fuels and Chemicals	388
6.1	Syngas fermentation for ethanol production	388
6.2	Syngas fermentation for butanol production	390
	References	390
